## English

### Features

The Pentax Spotting scope PF-80ED is a high-performance telescope employing advanced optical technology and based on Pentax's plentiful experience in this field.

Multicoating on each of the lenses ensures a clean image throughout the field of view. The eyepiece lens attachment is of the American 1 1/4 inch size generally used with astronomical telescopes. This enables use of the astronomical XL eyepiece, a high-performance eyepiece lens, and produces powerful, sharp images.

Nitrogen gas inside the unit prevents the lens from clouding over due to temperature differences and enables use in rain and inclement weather conditions.

### ⚠ WARNINGS

1. To avoid serious eye damage, NEVER look at the sun using the spotting scope.  
Serious damage to the retina, or total loss of eyesight may occur.
2. Do not leave the spotting scope in direct sunlight. Sun rays passing through the spotting scope will be intensified, and should they focus on flammable materials, fire may occur.

### ⚠ Safety Precautions

1. Take care not to let your fingers get caught up when you attached the spotting scope to the tripod.
2. Using the spotting scope continuously for a long time may cause inflammation of the skin around the eye where the eyepiece ring come in contact with the skin. Consult a physician if any symptoms are noticed.
3. Do not wave the instrument around, either in its case or with the tripod attached. It may hit someone and cause injury.
4. Take care with the vinyl bag and cap. To avoid any risk of suffocation, do not put the instrument within the reach of young children.

### Handling Precautions

1. The instrument cannot be used alone. It must always be used with the eyepiece lens, which must be purchased separately.
2. Do not apply too much force when turning the focus knob or the clamp screw or when attaching the instrument to the tripod. Excessive force will damage the instrument.
3. Do not drop the spotting scope or subject them to strong vibration, impact or pressure.
4. Never expose the spotting scope to high temperature (Over 60 degrees centigrade or 140 degrees Fahrenheit). Avoid leaving the spotting scope for an extended period of time in a hot humid place such as in a car parked in the sun or near a heater, as this could cause the spotting scope to become deformed.
5. Do not use the spotting scope under the water. When splashed with salty water, wipe off them with dry clean cloth moistend with fresh water.
6. Take care against sand and mud. Contact with sand and mud is likely to impair proper functioning. Take precautions in this respect when using the instrument.
7. Your Spotting scope is waterproof, but any drops of water attached to it after use should be wiped away with a dry cloth. Do not wipe with thinner, alcohol, benzene or any other chemical.  
If the lens has become dirty, first blow away any dust on the surface and then wipe gently with gauze or commercially available lens-cleaning paper soaked in a lens-cleaning solution.  
Wiping too hard when dust is attached to the lens may scratch the lens and should be avoided.
8. Spotting scope should be stored in a well-ventilated place to prevent fungus growth. Never store them in a closet with mothballs or in an environment where chemicals are handled.

## How to Use

- 1. Attach to the tripod.**

The spotting scope unit should be used attached to a tripod, etc. (see 1-1).  
The camera tripod screw hole at the bottom of the unit should be used to attach the tripod.  
Opening the fastener at the bottom of the case makes it possible to use the spotting scope attached to the tripod while the unit remains inside its case. (see 1-2)
- 2. Attaching the eyepiece lens (extra)**

Insert the eyepiece lens firmly into the eyepiece lens attachment section, turn the eyepiece lens fixing ring in the (→LOCK) direction on the unit, and fix the lens securely. (see 2)  
To remove, loosen the eyepiece lens fixing ring in the reverse direction from the locking direction and detach the lens.
- 3. Eye cap (for use with the Pentax XL Eyepiece and the Zoom Eyepiece)**

The position of the eye cap can be freely adjusted within the movable range. Adjust to obtain the best possible overall view. For further details on how to use the eye cap, see the explanation of use of the eyepiece lens. (see 3)
- 4. Collimator**

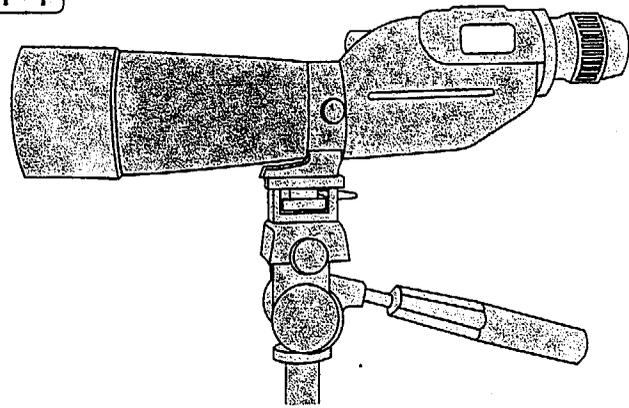

A collimator is set on top of the lens tube. The place in which a straight line of vision is obtained is the standard for the centre of the field of view of the eyepiece lens. (see 4)
- 5. Focusing**

Turn the focus knob and adjust so that the object can be clearly seen within the field of view. Turning the focus knob to the right (from the eyepiece lens side) enables focusing at long distances. Turning to the left results in focusing at short distances. (see 5)
- 6. Using the hood**

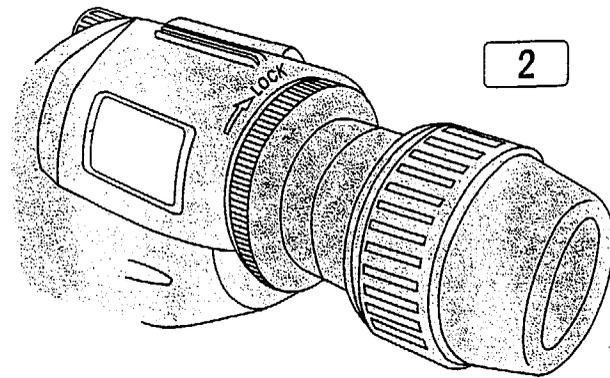

Pull out and use when necessary. (see 6)
- 7. Clamp screw**

Loosen the clamp screw to turn the unit freely to left or right and to obtain the most suitable posture for observation. There are eight click stops as the unit is rotated. Fix the clamp screw by tightening it in the most suitable position. (see 7)
